Application No. 10/710,895 Technology Center 1712

Reply dated September 14, 2010

In response to Office Action of May 14, 2010

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the

application.

**Listing of Claims:** 

Claims 1 through 10 (Canceled)

Claim 11 (Previously presented): A method of forming a thermal

barrier coating (26) on a surface of a component (10), the method comprising

the steps of:

forming the thermal barrier coating (26) at an elevated temperature

by co-evaporating carbon and a thermal-insulating material to deposit

elemental carbon in pores (32) that are within grains and at and between grain

boundaries of the thermal-insulating material, the pores (32) establishing an

open porosity within the thermal barrier coating (26); and then

during a subsequent high temperature excursion, partially sintering

the thermal barrier coating (26) at a temperature of at least 950°C to evolve a

carbon-containing gas from at least some of the elemental carbon and then

close at least some of the pores (32) to entrap the carbon-containing gas within the closed pores (32), the elemental carbon and/or the carbon-containing gas being present in an amount sufficient to thermally stabilize the microstructure of the thermal-insulating material:

wherein the pores (32) containing the carbon-containing gas are resistant to sintering, grain coarsening and pore redistribution.

Claim 12 (Original): A method according to claim 11, wherein the forming step comprises depositing the thermal barrier coating (26) by electron beam physical vapor deposition during which an ingot of the thermal-insulating material and a second ingot of a carbon-containing or carbide-containing material are simultaneously evaporated.

Claim 13 (Original): A method according to claim 12, wherein the second ingot comprises graphite.

Claim 14 (Previously presented): A method according to claim 11 wherein the open porosity within the thermal barrier coating (26) constitutes at least 25 volume percent of the thermal barrier coating (26).

In response to Office Action of May 14, 2010

Claims 15-17 (Canceled)

Claim 18 (Previously presented): A method according to claim 11,

wherein the sintering step forms additional pores (32) that entrap the carbon-

containing gas.

Claim 19 (Canceled)

Claim 20 (Original): A method according to claim 11, wherein the

thermal-insulating material is vttria-stabilized zirconia and the thermal barrier

coating (26) comprises columnar grains (30).

Claims 21 through 25 (Canceled)

Claim 26 (New): A method according to claim 11, wherein the

thermal-insulating material has a binary composition containing a stabilizer.
